Decoding GenAI Ethics Beyond Mere "Right" and "Wrong": Toward a Dual-Layer Framework, Construct Validity, and Reliable Measurement

Online Supplementary Materials for Transparency

Supplementary Materials A

Understanding the dimensions of AI ethics is a prerequisite for addressing the challenges it raises. To better understand the dimensions of GenAI ethics, we start by reviewing the literature on AI ethics. AI ethics is notably abstract, encompassing many meanings and incorporating multifaceted elements. The existing dimensions of AI ethics are primarily derived from ethical guidelines issued by governments, semi-official organizations, major technology enterprises, and academic associations that they believe warrant attention and resolution.Examples of these guidelines include the Organisation for Economic Co-operation and Development (OECD, 2019), the European Union, the United Nations Educational, Scientific and Cultural Organization (UNESCO), academic associations such as the Association for Computing Machinery (ACM, 2017) and the Institute of Electrical and Electronics Engineers (IEEE, 2017), as well as leading global technology corporations like Microsoft, Google, and IBM, which have also released AI ethics guidelines.

Scholars have analyzed these guidelines to identify and categorize the dimensions of AI ethics (see Table S.A.1). For instance, Jobin et al. (2019) Conducted a content analysis of 84 AI ethics guidelines and principles issued by various global institutions, highlighting eleven universal principles for AI ethics. Among these principles, more than half of the AI ethics guidelines addressed transparency, fairness, responsibility, privacy protection, and non-malevolence. Fjeld et al. (2020) used a qualitative approach to categorize AI ethics themes, revealing thematic categories such as privacy, accountability, safety and security, transparency and explainability, fairness and nondiscrimination, human control of technology, professional responsibility, and promotion of human values. Scholars have also attempted to explore the theoretical dimensions of AI ethics. Floridi et al. (2018) constructed an ethical framework for a positive AI society, incorporating beneficence, non-maleficence, autonomy, justice, and explicability dimensions. Mikalef et al. (2022) proposed that building responsible AI requires considerations of fairness, transparency, accountability, safety, data governance, legal regulation, benefit to humanity, and societal and environmental well-being.

Table S.A.1 Dimensions of AI Ethics

Research object	The dimensions of AI ethics	Literature
Content-analyzed 84 principles and guidelines for ethical AI	Transparency, justice, fairness & equity, nonmaleficence, privacy, trust, responsibility, accountability, beneficence, sustainability, and solidarity	Jobin et al. (2019)
Thematic catalog of AI ethical principles	Privacy, accountability, safety and security, transparency and explainability, fairness and nondiscrimination, human technology control, professional responsibility, and promotion of human values.	Fjeld et al. (2020)

Ethical design principles of AI	Explainability, fairness, security, accountability, accuracy, privacy, and machine autonomy	Kieslich et al. (2022)
Ethical framework for AI and digital technologies	Physical domain: dignity and well-being, safety, sustainability; cognitive domain: intelligibility, accountability, fairness, promoting, prosperity, solidarity, autonomy; information domain: privacy, security; governance domain: regulatory impact, financial and economic impact, individual and societal impact	Ashok et al. (2022)
Ethical issues of the information age	Privacy, accuracy, property, and access	Mason (1986) and Chatterjee et al. (2015)
AI4People—An ethical framework for a good AI society	Beneficence, non-maleficence, autonomy, justice, explicability	Floridi et al. (2018)
AI ethics in marketing	Beneficence, non-maleficence, justice, explicability, autonomy	Hermann (2022)
Minimal requirements for building and using an "ethically sound" AI system	Accountability, privacy, and fairness	Hagendorff (2020) and Mikalef et al. (2022)
AI ethical principles	Beneficence, non-maleficence, autonomy, justice, and explicability	Morley et al. (2020)
Responsible AI principles	Justice/fairness, inclusiveness, reliability and safety, beneficence, non-maleficence, autonomy	Liu et al. (2023)
Responsible AI dimensions	Fairness, transparency, accountability, robustness, safety, data governance, laws and regulations, human oversight, societal and environmental well-being	Mikalef et al. (2022)
Ethical concerns related to algorithmic use	Inconclusive evidence, inscrutable evidence, misguided evidence	Mittelstadt et al. (2016)

Table S.B.2. The Semi-Structured Questionnaire

Cover letter

Dear Sir/Madam,

We are a research team composed of professors in the field of management from three universities, currently conducting a study on ethical issues related to Generative Artificial Intelligence (Generative AI). We cordially invite you to participate in our research by providing insights on questions related to your use of Generative AI. To facilitate your participation, we would like to provide you with a brief introduction to the concepts of ethics and Generative AI:

Ethics involves making value judgments about the rightness or wrongness, goodness or badness of something or an action.

Generative AI refers to AI technologies capable of automatically producing content, such as ChatGPT, Midjourney, Google PaLM 2, etc. These technologies enable AI-generated writing, drawing, composing, and more.

Presently, ethical issues in AI have gained significant attention, particularly ethical concerns within the context of Generative AI applications. Through this study, we aim to gain a better understanding of the ethical issues users might perceive when utilizing content generated by Generative AI, as well as the specific elements contributing to these concerns. In order to achieve this objective, we are conducting a series of semi-structured interviews to gather user viewpoints and experiences. We believe that your insights and experiences will play a crucial role in shaping our research and providing valuable insights for the improvement of Generative AI.

The interviews will be conducted through group discussions, phone calls, or online video meetings, and are expected to last for 30-60 minutes. During the interview, we will ask you questions about your experiences and perceptions regarding the use of Generative AI. You are free to share your opinions and are also welcome to choose not to answer any questions that make you uncomfortable. We will strictly protect your personal information, ensuring the confidentiality of your responses for research purposes only.

We sincerely appreciate your consideration in participating in this study. Your time and assistance are invaluable to our research.

The Authors

Interview Questionnaire

1. Background and Usage

1.1 Could you please provide a brief description of your experience with using Generative Artificial Intelligence (AI), such as ChatGPT or AI-based drawing software?

1.2 Under what circumstances do you typically utilize Generative AI to generate content? What are your usual objectives when using Generative AI for tasks?

1.3 Does the content generated by the Generative AI meet your expectations? What are the issues with content generated by GAI?

2. Open-ended Ethical Questions

2.1 Throughout your experiences with using Generative AI, have there been any specific events or instances that prompted you to contemplate its ethical implications? When generating content using Generative AI, what

aspects have made you feel uneasy or concerned?

2.2 In your opinion, what aspects of Generative AI might potentially raise ethical concerns? Could you briefly explain your thoughts on each aspect?

2.3 What factors, in your view, might influence your level of trust in Generative AI? How do these factors impact your overall user experience?

2.4 In your perspective, what areas of focus or improvement should AI developers consider when it comes to using Generative AI? Why? Additionally, where do you believe you personally need to exercise more caution or seek improvements? Why?

2.5 Has your organization or university imposed any restrictions on your use of AI-generated content? Have you encountered situations where you felt it might be inappropriate to use AI-generated content?

2.6 Why do you think people might still choose to use AI-generated content even when it's not explicitly permitted?

3. Influencing Factors, Consequences, and Mitigation Measures

3.1 What factors do you think can influence the ethical issues of Generative AI? For instance, technological, legal, social, or other factors.

3.2 In your opinion, what societal impacts might arise from the ethical concerns related to Generative AI?

3.3 How do you think the ethical challenges of Generative AI should be addressed or mitigated? Do you have any suggestions on addressing the ethical issues of Generative AI?

4. Human Capabilities in Using Generative AI

4.1 Could you please describe the specific details of your process when using Generative AI?

4.2 In order to effectively use Generative AI and get satisfactory outputs, what should users pay attention to? What abilities of users are necessary?

4.3 What factors do you think hinder you to use Generative AI effectively and obtain satisfactory outputs? What can users do to improve the output quality of GAI?

5. Your Personal Information (Will be kept strictly confidential)

Supplementary Materials C

Table S.C.1. Process and Prompts for Generating Initial Items Using ChatGPT

Our process for using ChatGPT was as follows. First, we used a structured prompt framework to explain the task background and objectives to ChatGPT. We then asked it in reverse to confirm whether it fully understood the task. The structured prompts included the following elements: introducing our roles, providing background on our task, clarifying our objectives, assigning an expert role to ChatGPT,

and specifying the requirements for ChatGPT's output. The prompt we used was: "We are scholars in the field of information systems management, currently researching GenAI ethics. Our study has identified categories and dimensions of GenAI ethics, which are represented by 19 constructs in our paper. We must now develop Likert scales for these 19 constructs to measure them effectively. You are a scale development expert who is highly familiar with scale writing. We hope you can assist us in writing scales for these constructs. We will provide examples of established scales, definitions, and explanations for each construct we need to measure to help you create context-specific items. Do you understand our requirements and what you need to do?"

Second, to ensure high-quality scale outputs, we followed MacKenzie et al. (2011) by developing the items for each construct based on three sources: the construct's definition, open codes, and relevant existing literature. We gradually trained ChatGPT to learn the standards of scale writing. First, we input several widely used, rigorously developed scales from empirical articles in MIS Quarterly (Bhattacherjee, 2001; Venkatesh et al., 2003; Venkatesh et al., 2012), allowing ChatGPT to study and learn from these examples. Next, we provided ChatGPT with background materials for the target construct of our scale development, including the construct's definition, explanations, related open coding, and user comments. Based on this information, we asked ChatGPT to write 10 items for the current construct. We set specific writing requirements for ChatGPT: the items should be concise, easy to understand, and straightforward to avoid ambiguity (MacKenzie et al., 2011). We asked about each construct individually, covering a total of 19 constructs. For each construct, we interacted with ChatGPT 2-5 times.The reasons for multiple interactions were: (1) ChatGPT's output for the scales sometimes did not meet our requirements. For example, items occasionally did not precisely reflect the intended meaning of the construct definition; sentences were too long; items included parallel adjectives or descriptive phrases; or the items failed to capture the construct's definition accurately. (2) Each time ChatGPT generated an answer, slight differences allowed us to choose the best possible answer. We observed that ChatGPT made more mistakes in the initial interactions but progressively learned the rules of scale writing. We then carefully reviewed and refined each item after ChatGPT generated responses. Finally, five items were retained for each construct.

Table A.5. Users' Perceived GenAI Ethics Scale (SITI Scale) for First-Order Constructs	
Constructs	**Items**
Privacy	1.I worry that GenAI may misuse my personal information.
	2. When using GenAI, my personal data is at risk of being leaked.
	3. The privacy protection measures of GenAI have worrisome vulnerabilities.
	4. GenAI may share my personal information with third parties.
	5. I worry about breaches in my personal data when using the generative AI.
User exploitation	1. I sometimes suspect that generative AI understands my preferences, which could lead to manipulative practices.
	2. Generative AI may manipulate me without my full awareness.
	3. AI-generated content influences my decisions subtly.
	4. The generative AI could influence my actions more than I realize.
	5. AI-generated content seems designed to affect user behavior subtly.
Harassment	1. GenAI could facilitate the generation of harassing messages toward individuals or groups.
	2. GenAI increases the risk that users can mass-produce harassing content.
	3. GenAI enables users to mass-produce harassing content.
	4. GenAI increases the likelihood of users being exposed to online harassment caused by AI-generated content.
	5. The mass content generated by GenAI exacerbates the sense of online harassment.
Property infringement	1. I am concerned about accidentally infringing on others' intellectual property rights when using this generative AI.
	2. I worry that using content generated by this generative AI may violate someone else's intellectual property.
	3. Sometimes, I feel that my own intellectual property rights are not respected by others using this generative AI.
	4. I am wary of how this generative AI handles the intellectual property rights of the content it produces.
	5. Property rights are at risk of being violated when engaging with this generative AI.
Crime affordance	1. I am concerned that generative AI could be used to facilitate criminal activities.
	2. I perceive generative AI as a tool that could easily enable deviant behaviors.
	3. I worry about the potential misuse of generative AI for unlawful purposes.
	4. I am wary of how easily generative AI can be adapted for criminal use.
	5. The capabilities of generative AI make it susceptible to being exploited for criminal activities.
Inaccuracy	1. The AI-generated content contains errors.

	2. The AI-generated content exhibits inaccuracies in its details.
	3. The AI-generated content deviates from established facts.
	4. The AI-generated content requires corrections to improve its accuracy.
	5. The AI-generated content has a limited degree of accuracy.
Bias	1. The AI-generated content exhibits discriminatory biases.
	2. The AI-generated content contains algorithmic bias.
	3. The AI-generated content manifests cognitive biases in its outputs.
	4. The AI-generated content contains discriminatory information.
	5. The AI-generated content undermines equality and amplifies discrimination.
Fakeness	1. I frequently suspect that AI-generated content is not genuine.
	2. I am wary of the authenticity of content generated by the GenAI.
	3. It's hard to tell if the AI-generated content is true or false.
	4. I often encounter deceptive AI-generated content online.
	5. I doubt the authenticity of most AI-generated information.
Harmfulness	1. GenAI-generated content sometimes includes harmful elements like hate speech or violence.
	2. I find generative AI may produce offensive content
	3. GenAI-generated content sometimes contains violent or pornographic themes.
	4. GenAI-generated outputs may contain disrespectful or harmful information.
	5. Generative AI may produce toxic content.
Explainability	1.I find the explanations of how generative AI makes decisions to be vague and complicated.
	2. The mechanisms behind generative AI decisions are difficult for me to comprehend.
	3. I find generative AI's decision-making processes obscure and hard to understand.
	4. Generative AI provides complicated and incomprehensible explanations for its decision-making processes.
	5. It is difficult to grasp how and why the generative AI arrives at specific conclusions.
Transparent information sources	1.The generative AI conceals the data sources it uses.
	2. The generative AI makes the origins of its data and information inputs opaque.
	3. The sources feeding into the generative AI's decision-making are poorly disclosed.
	4. I find it hard to know where and how the generative AI gathers its information.
	5. I know very little about the origins of the information behind GenAI's content.
Transparent generation process	1. The generative AI vaguely discloses its decision-making methods.
	2. The processes of AI generation are hidden from users.
	3. In most cases, the generative AI conceals its methods of operation from users.
	4. The pathways by which the generative AI reaches decisions are obscurely presented.
	5. The generative AI's decision generation processes are vaguely shown.
Social divide	1. The use of generative AI is likely to widen the social divide among different groups further.
	2. The disparities in access to generative AI will exacerbate social inequalities.
	3. The disparities in generative AI use will exacerbate social inequalities.
	4. The unequal benefits derived from generative AI are expected to deepen existing societal gaps.
	5. The use of generative AI will contribute to a growing divide in how societal groups can leverage technology.
Job displacement	1. Generative AI is increasingly substituting for tasks traditionally performed by humans.
	2. Generative AI is replacing human jobs.

	3. The prevalence of generative AI leads to a reduction in human employment.
	4. Generative AI adoption has caused a significant reduction in human jobs.
	5. Generative AI can replace many jobs currently done by people.
Environment harming	1. The development and use of generative AI leads to environmental harm.
	2. The energy consumption of generative AI operations is a major environmental concern.
	3. The development and use of generative AI harms the environment.
	4. The carbon footprint of generative AI is substantial.
	5. Running generative AI requires vast amounts of energy.

PRI = Privacy; PRO = Property infringement; HAR = Harassment; USE = User exploitation; CRI = Crime affordance; INA = Inaccuracy; BIA = Bias; FAK = Fakeness; HARM = Harmfulness; INF = Transparent information sources; GEN = Transparent generation process; EXP = Explainability; SOC = Social divide; JOB = Job displacement; ENV = Environment harming; CIU = Continued intention to use; IU = Intention to use; UB = Use behavior.

Note.

[i] First, we recruited 20 master's and doctoral students to assess content validity and paid each participant RMB 50.
Second, we provided participants with the definitions of 15 constructs and 75 candidate items and asked them to assign each item to the construct that best matched its meaning based on the definitions. Participants were unaware of the research team's intended item assignments.
Next, we summarized the classification results for each item, recording the number of participants who assigned it to its intended construct n_c and the highest number who assigned it to any single unintended construct n_c.
We then followed Anderson and Gerbing (1991) to calculate the proportion of substantive agreement *(Psa=nc/N)* and the substantive validity coefficient *(Csv=(nc-no)/N)* for each item, where N denotes the total number of valid raters for that item. The former indicates the extent to which participants agree with the item's intended assignment, whereas the latter indicates the extent to which assignment to the intended construct exceeds assignment to the strongest competing construct.
Finally, following Hoehle and Venkatesh (2015), we required both indices to reach 0.60 or higher for item retention.
